BLUEWRIST MOUNTS GOCATOR 2300 SMART SENSORS ONTO ROBOTIC END EFFECTOR IN ITS WINDSHIELD INSERTION SYSTEM

The Challenge

Manual insertion of glass into car bodies is labour intensive and imprecise, with the opportunity for body damage and glass breakage leading to significant safety risks to assembly operators.

Alternatively, robotic insertion methods are complicated because the car body location is not precise, and therefore requires vision guidance to transform robot end effectors to compensate for body location variation and to optimize the position of the glass.

The Solution

Bluewrist mounted 4 Gocator 2300 series 3D smart sensors on the robot end effector of their insertion system in order to monitor the location of 4 critical points on the windshield aperture. Technicians used Gocator’s built-in Edge Tool to determine the 3D location of critical points on the aperture.

Gocator 3D measurements were then communicated to an external PC equipped with Bluewrist EzRG Advanced Robot Guidance Software, which calculates transformation data in 6 degrees of freedom and then sends its calculations to the robot controller. EzRG provides a wide range of robot guidance and user-frame calculation strategies, including Best-fit of Measurement, 3-2-1 Fixturing, and a User-Frame Formulas Interpreter. The calculation takes less than 0.5 seconds and the guidance accuracy can achieve up to 0.2mm.
The Gocator’s built-in smart measurement and exposure control delivers a 3D solution at incredible value.

– Najah Ayadi, President of Bluewrist

The Results

The Bluewrist Windshield Insertion System was successfully demonstrated at AMTS 2015, providing a strong example of how LMI and Bluewrist are working together to create more robust robotic guidance machine vision systems.

Gocator-Guided Windshield Insertion In Progress

To learn more about Gocator All-In-One 3D Smart Sensors, please email contact@lmi3d.com

ADVANTAGES OF THE GOCATOR 3D SMART SENSOR:

- Gocator’s automatic exposure accurately measures all colors, essential for painted bodies
- Compact and rugged, sensors are easily mounted on the end effector without interfering with other components
- All-in-one design results in more room in the electrical panel for other critical components
- Immune to robot movement and vibration
- Gocator’s light weight does not add significant mass to the end effector
- Gocator smart sensors’ all-in-one design and simplified cabling allow it to integrate seamlessly with robotic machinery
- Built-in measurement tools eliminate image analysis software development

ADVANTAGES OF THE BLUEWRIST WINDSHIELD INSERTION SYSTEM:

- Demonstrates 3D sensing integrated with robotic automation
- Automates insertion process with high accuracy and speed
- Replaces manual insertion process for components that are not precisely fixtured
- Improves quality and operator safety

POINTS TO HIGHLIGHT:

- Gocator easily mounts on robot end effectors for complex 6DOF guidance for assembly
- Long term partnerships lead to solutions for new applications
